

The Petting Zoo — draft plan

Seat 5 · Steven · How's the wife? | 10-team full PPR, 14-man roster | generated 2026-08-30

Built by playing **40 full drafts** from this seat, with the other nine teams drawn from real ADP behaviour. Shown below is the median outcome — its finished lineup projects to **2082 points** (across all boards: 2056–2105). Resulting roster: 1 D/ST · 1 K · 1 QB · 5 RB · 2 TE · 4 WR.

Availability is how often that player was still on the board at that pick across all simulated drafts. Anything under ~40% is a target you should expect to miss regularly — plan on the backup.

How to read this

This is a plan, not a script. The value of it is the **shape** — which positions to attack in which rounds, and which names are realistic when your turn comes. The exact players will differ on the night; that is what the backups are for, and why each one carries its own reason. Take the live agent's call over this sheet whenever they disagree: it can see the actual board and this cannot.
